Herma Quartz Stone

Herma Sintered Stone

Quartz is composite material, which has the durability of natural stone. One of the best things about quartz is that it's scratch-proof and can easily withstand chipping. Which makes it low-maintenance.

Quartz has a consistent stone quality, which gives your worktop a more finished look and feel. Also, buying a quartz worktop helps in contributing to the green revolution since it contains waste materials.

Quartz stone is now much preferred for any type of building surfaces. Kitchen top, vanity top, bench-top, platforms, floors or walls.

Quartz countertops are fabricated from natural quartz. One of the hardest minerals found in the Earth, and small amounts of glass or metallic flecks are added to create variety. Resulting in beautiful countertops.

Other advantage of quartz is that it is a non-porous material. Its texture does not allow bacteria to grow and resists against stains. Protecting your family and making kitchen clean-up easy. For this reason, quartz countertops never need to be sealed.

Sintered Stone can use on outdoor walls and floors, as well as indoor walls and floors, as well as countertops.

The scope of application is higher than that of most artificial stone materials.

Sintered Stone is a 100% natural material based on granite minerals, glass minerals and natural oxides.

The advantage of Sintered stone is that sintered stone has no color variation like natural stones.

You can use sintered stone for large areas.

The hardness of the sintered stone is harder than that of natural marble.

It is wear-resistant and does not have wear marks after it has been used for a long time.

And its luminosity is about the same as the new one.
